

How your website's content system works

A plain-language guide to changing the words on your website yourself, what happens when you do, and what keeps it safe.

A shop window and a back office

Your website is really two separate things. Keeping them apart is what makes it safe to edit.

The back office

A private screen with simple forms. You type into labelled boxes: a question and its answer, a person's name and role. Only people with a login can get in.

The shop window

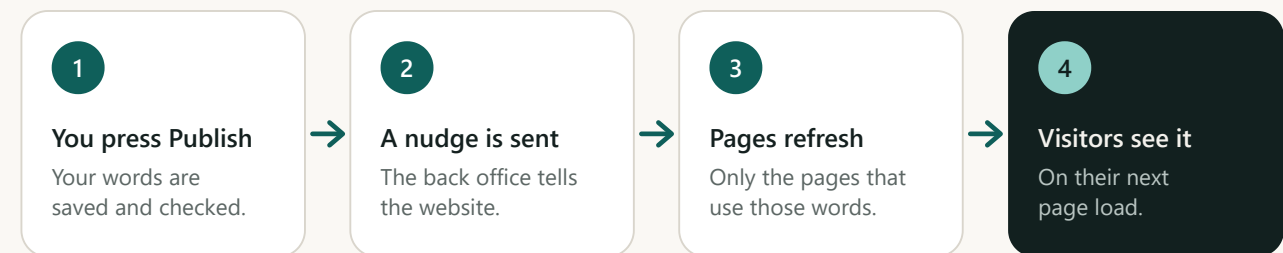

The public website. It takes your words and places them into a design that was built once and does not change. Visitors never see the back office.

Why this matters

Because the design lives in the shop window and you only work in the back office, **you can change the words but you cannot break the design.**

From your keyboard to the live site in seconds

Nobody has to "upload" or "deploy" anything. Four things happen by themselves.

How fast is it?

In testing, a change showed on the website within a few seconds. As a backstop, the website also checks for changes by itself every hour, so nothing stays out of date for long.

What about a draft?

Press **Save Draft** and nothing is sent. Press **Preview** to see your draft on the real website, with a banner that says only you can see it.

If the back office is ever closed

This was tested by switching the back office off on purpose. Every page kept working.

You own the words. The design stays put.

Four kinds of content are yours to manage today. Everything else is part of the design and needs a developer.

You can change

- **Questions and answers**
The FAQ page. The first six also show on the homepage.
- **Testimonials**
Name, quote, role and company.
- **Team members**
Name, role, specialty and current focus.
- **Case studies**
The story of each project, from the problem to what changed. Each one gets its own page.

You cannot change

- **Layout, colours and fonts**
Where things sit and how they look.
- **Menus, headings and the footer**
Including the tagline and contact details.
- **Pictures**
This version does not upload images. Illustrations are picked from a built-in set of four.
- **New pages or sections**
A blog or a news page is a small project, quoted separately.

Sensible limits are built in

Length

A question holds up to 160 characters, an answer up to 1,200. Longer text is refused, with a message saying why.

How many

No practical limit. A test with 116 questions showed every one of them.

Languages

Accents, Japanese, Arabic and emoji are saved and shown exactly as typed.

Want more to be editable?

Short lists such as the service packages, the About page values and the process steps are quick to add. Headings and the homepage headline take a little longer. Ask, and it can be quoted.

How to do the things you will actually do

Sign in, pick the type of content from the menu on the left, and follow the row that fits.

YOU WANT TO	WHAT YOU DO
Change something	Open the item, edit the labelled boxes, press Update .
Add something	Press Add , fill in the boxes, press Publish .
Work on it privately	Press Save Draft . Nobody else sees it. Press Preview to check it on the real site first.
Publish it later	Set a date and time, then press Publish. It goes live by itself.
Change the order	Change the Order number. Lower numbers appear first on the page.
Remove something	Press Move to Trash . It leaves the website but stays in Trash for 30 days.
Undo a change	Open the item, press Browse revisions , pick an earlier version and press Restore .

What your screen looks like

The image shows a simplified drawing of a content management system interface. On the left is a dark sidebar menu with the following items: Dashboard, Case studies, FAQs (highlighted in teal), Testimonials, Team, and Profile. The main content area is light gray and contains a form with two sections: 'QUESTION' and 'ANSWER'. The 'QUESTION' section has a text input field containing 'Do you work with small teams?'. The 'ANSWER' section has a text input field containing 'Yes. Most of our clients are teams of fewer than twenty people.' To the right of the form is a control panel with two buttons at the top: 'Save Draft' and 'Preview'. Below these is an 'Order' section with a text input field containing the number '3'. At the bottom of the control panel are two buttons: 'Move to Trash' (in orange text) and 'Publish' (in a teal button).

Simplified drawing. The real screen has the same parts in the same places.

What stops a small mistake becoming a big one

The system assumes people make mistakes and is built to catch or undo them.

It checks before publishing

Leave a required box empty and it will not publish. It tells you which box, in plain words.

Trash is not gone

Removed items wait in Trash for 30 days. You can bring them back with one click.

Every change is remembered

Saved versions of an item are kept from your second edit onward. You can look back and restore one.

The website double-checks

Anything that slips past the forms is checked again by the website. An entry that fails is left off the page instead of breaking it.

Pasted code is harmless

If someone pastes computer code into a box, visitors only ever see it as plain text. It cannot run.

Limited accounts

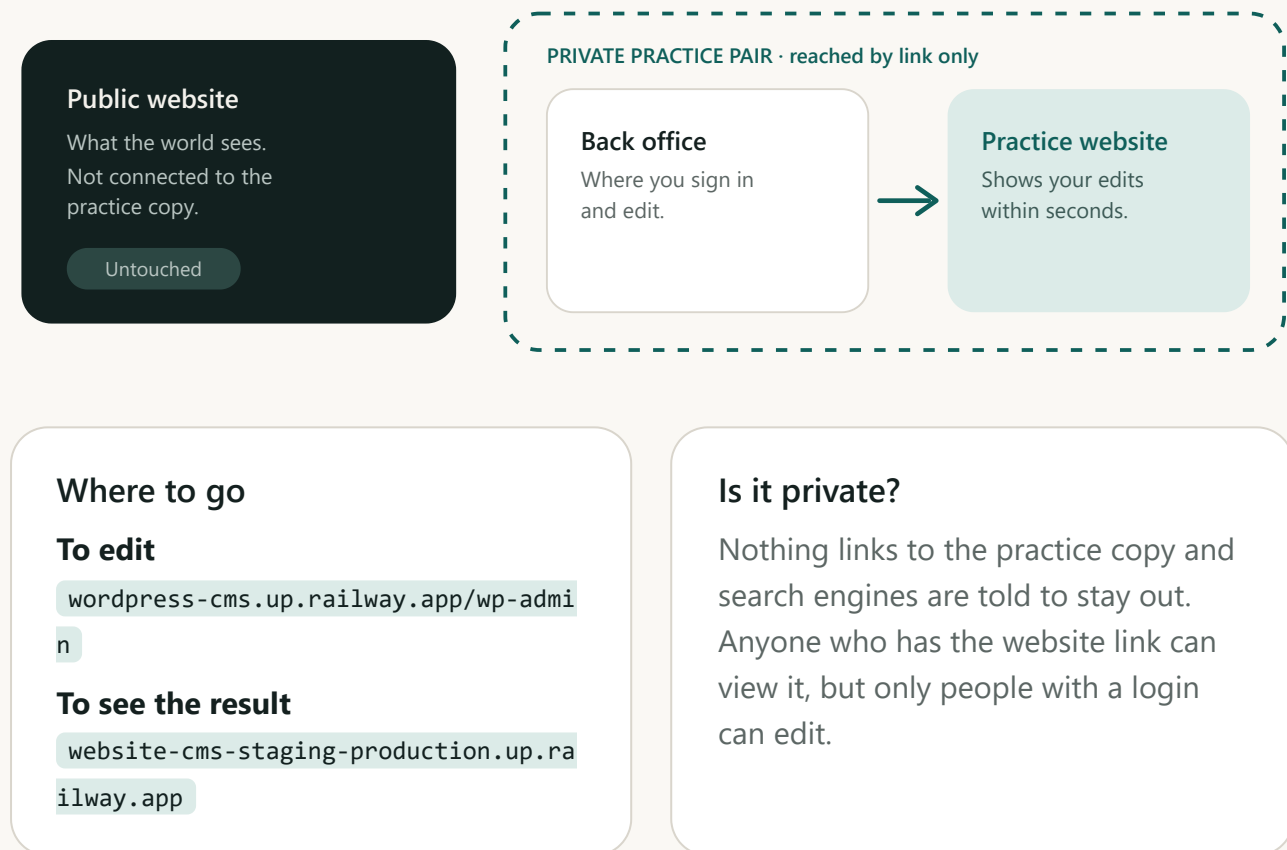

An editor's login only shows the content. Settings, plugins and other users are hidden and blocked.

What you can still get wrong

- **A typo.** The system checks that boxes are filled, not that the words are right. Use Preview.
- **Two people editing the same item.** The last save wins. Agree who edits what.
- **Sharing a login.** Give each person their own account, so changes can be traced and access removed.

A private practice copy

The content system runs on a separate practice copy of the website.
The public site is never touched while you learn.

A good first session

- 1 Sign in and open **FAQs**. Add a question and press Publish.
- 2 Open the practice website's FAQ page and reload. Your question is there.
- 3 Change its Order number, reload again, and watch it move.
- 4 Start a new item, press Save Draft, then Preview. Then move your test items to Trash.

After a session, the site owner can press **Reset demo content** to put everything back to how it started. Anything you added goes to Trash, not into thin air.

Honest answers and plain definitions

The questions people ask most, answered without the jargon.

Can I break the website?

Not the design. You can publish a typo or remove an item, and both can be undone.

Is a change instant?

It shows the next time a page is loaded, usually within seconds. At worst, within the hour.

Can I add a page?

No. A new page or section is design and build work, quoted separately.

Who can look after it?

Many people know WordPress, the back office. The website itself needs a developer who knows how it was built.

Not part of this version

- Uploading pictures, and bold text, links or lists inside your words.
- Two-step sign-in and a log of who changed what.
- Automatic backups and monitoring on the practice copy.

Words explained

Content system (CMS)	The tool that lets you change a website's words without a developer.
WordPress	The back office used here. A widely used editing tool.
Publish	Make something visible on the website.
Draft	Saved, but only you can see it.
Preview	A private look at a draft on the real website.
Revision	An earlier saved version of an item, kept so you can go back.
Practice copy (staging)	A private twin of the website for testing and demonstrations.
